Urease Broth Concentrate 10

Intended Use
Urea Agar and Urease Test Broth are used for the differentiation of organisms, especially the Enterobacteriaceae, on the basis of urease production.

Summary and Explanation
Urea Agar was devised by Christensen for use as a solid medium for the differentiation of enteric bacilli. It differentiates between rapid urease-positive Proteaeae organisms (Proteus spp., Morganella morgani subsp. morgani, Providencia rettgeri, and some Providencia stuartii) and other urease-positive organisms: Citrobacter, Enterobacter and Klebsiella and bacteria other than Enterobacteriaceae; i.e., some Bordetella and Brucella spp. The base is also supplied as a filter-sterilized 10 concentrated solution in tubes for use in preparing Urea Agar slants in the laboratory.

Urease Test Broth was developed by Rustigian and Stuart. It may be used for the identification of bacteria on the basis of urea utilization and it is particularly recommended for the differentiation of members of the genus Proteus from those of Salmonella and Shigella in the diagnosis of enteric infections. The medium is positive for Proteus, Morganella morgani subsp. morgani, Providencia rettgeri, and a few Providencia stuartii strains with the reclassification of the members of the Proteaeae.

Urease base is also supplied as a filter sterilized 10 concentrated solution for use in preparing Urease Test Broth in the laboratory.

Principles of the Procedure
The urea medium of Rustigian and Stuart is particularly suited for the differentiation of Proteus species from other gram-negative enteric bacilli capable of utilizing urea; the latter are unable to do so in Urease Test Broth because of limited nutrients and the high buffering capacity of the medium. To provide a medium with greater utility, Urea Agar was devised by Christensen with peptone and dextrose included and reduced buffer content to promote more rapid growth of many of the Enterobacteriaceae and permit a reduction in incubation time. The complete Urea Agar contains 15.0 g/L of agar in addition to the ingredients in the base medium.

When organisms utilize urea, ammonia is formed during incubation which makes the reaction of these media alkaline, producing a red-pink color. Consequently, urease production may be detected by the change in the phenol red indicator.
User Quality Control
NOTE: Differences in the Identity Specifications and Cultural Response testing for media offered as both Difco™ and BBL™ brands may reflect differences in the development and testing of media for industrial and clinical applications, per the referenced publications.

Identity Specifications
Difco™ Urea Broth
Dehydrated Appearance: Light orange to light pink, homogeneous, inherently lumpy.
Solution: 3.87% solution, soluble in purified water.
Prepared Appearance: Orange-yellow, clear.
Reaction of 3.87%
Solution at 25°C: pH 6.8 ± 0.1

Identity Specifications
BBL™ Urea Agar Base
Dehydrated Appearance: Fine, homogeneous, free of extraneous material.
Solution: 29 g/100 mL solution, soluble in purified water.
Prepared Appearance: Complete medium is light to medium orange, clear to slightly hazy.
Reaction of 2.9%
Solution at 25°C: pH 6.8 ± 0.2

Cultural Response
Difco™ Urea Broth
Prepare the medium per label directions. Inoculate with fresh cultures and incubate at 35 ± 2°C for 8-48 hours.

ORGANISM ATCC** UREAASE REACTION
Enterobacter aerogenes 13048 –
Escherichia coli 25922 –
Proteus mirabilis 25933 +
Proteus vulgaris 13315 +
Salmonella enterica subsp. enterica serotype Typhimurium 14028 –

Cultural Response
BBL™ Urea Agar Base
Prepare the medium per label directions. Inoculate with fresh cultures (2 heavy loopfuls) and incubate at 35 ± 2°C for 24 hours.

ORGANISM ATCC** UREAASE REACTION
Proteus vulgaris 8427 +
Salmonella enterica subsp. enterica serotype Typhimurium 13311 –

Formulae
BBL™ Urea Agar Base
Approximate Formula* Per Liter
Pancreatic Digest of Gelatin ........................................ 1.0 g
Dextrose ..................................................................... 1.0 g
Sodium Chloride ......................................................... 5.0 g
Potassium Phosphate .................................................. 2.0 g
Urea .......................................................................... 20.0 g
Phenol Red................................................................ 12.0 mg

Difco™ Urea Broth
Approximate Formula* Per Liter
Yeast Extract .............................................................. 0.1 g
Monopotassium Phosphate ........................................... 9.1 g
Dipotassium Phosphate ............................................... 9.5 g
Urea .......................................................................... 20.0 g
Phenol Red................................................................ 0.01 g

*Adjusted and/or supplemented as required to meet performance criteria.

Directions for Preparation from Dehydrated Product
BBL™ Urea Agar Base
1. Dissolve 29 g of the powder in 100 mL of purified water. Mix thoroughly. Sterilize by filtration.
2. Suspend 15 g of agar in 900 mL of purified water.
3. Autoclave at 121°C for 15 minutes.
4. Cool to 50°C and add 100 mL of the sterile Urea Agar Base.
5. Mix thoroughly and dispense aseptically in sterile tubes.
6. Cool tubed medium in a slanted position so that deep butts are formed.
7. Do not remelt the complete medium.
8. Test samples of the finished product for performance using stable, typical control cultures.
**BBL™ Urea Agar Base Concentrate 10 (Prepared Tubes)**

1. To prepare Urea Agar medium, add 1.7 g of granulated agar to 100 mL of purified water. Heat with agitation and boil for 1 minute.
2. Dispense aseptically in 1-3 mL amounts, in small sterile test tubes and autoclave at 121°C for 15 minutes.
3. Cool the agar to 45-50°C, and allow one tube of concentrate to come to room temperature. Add 1 mL of concentrate to each 9 mL of cooled agar solution and mix thoroughly.
4. Allow the tubes to cool in a slanted position so that slants with deep butts are formed.
5. Test samples of the finished product for performance using stable, typical control cultures.

**Difco™ Urea Broth**

1. Equilibrate the medium to room temperature before opening. The presence of urea in this medium renders it inherently lumpy. This condition will not adversely affect a properly stored medium.
2. Dissolve 38.7 g of the powder in 1 L of purified water. Mix thoroughly to completely dissolve the powder.
3. Filter sterilize. DO NOT BOIL OR AUTOCLAVE THE CONCENTRATE.
4. Test samples of the finished product for performance using stable, typical control cultures.

**BBL™ Urease Broth Concentrate 10 (Prepared Tubes)**

1. To prepare medium, aseptically add 10 mL of the concentrate to 90 mL of cold sterile purified water. Mix thoroughly.
2. Dispense aseptically in 1-3 mL amounts, in small sterile test tubes.

**Procedure**

If Urea Agar Base Concentrate 10 or Urease Broth Concentrate 10 is being used, prepare the complete medium as described above. If crystals form in the concentrate, they will usually dissolve at room temperature, or in a few minutes in a 40°C water bath.

Using a heavy inoculum (2 loopfuls) of growth from an 18- to 24-hour pure culture (TSI Agar or other suitable medium), inoculate the broth or agar (streaking back and forth over the entire slant surface). Do not stab the butt since it serves as a color control. For broth, shake tubes gently to suspend the bacteria. Incubate tubes with loosened caps at 35 ± 2°C in an incubator or water bath. Observe reactions after 2, 4, 6, 18, 24 and 48 hours. For agar, continue to check every day for a total of 6 days; even longer incubation periods may be required to reach positive (alkaline, pH 8.1) results.

**Expected Results**

The production of urease is indicated by an intense pink-red (red-violet) color on the slant or throughout the broth. The color may penetrate into the agar (butt); the extent of the color indicates the rate of urea hydrolysis. A negative reaction is no color change. The agar medium remains pale yellow to buff; the broth remains yellowish-orange.

For a listing of urease-positive organisms, consult appropriate texts.² ⁴-⁷

**Limitations of the Procedure**

**Urea Agar Base**

1. The alkaline reaction produced in this medium after prolonged incubation may not be caused by urease activity. False positive reactions may occur due to the utilization of peptones (especially in slant agar by *Pseudomonas aeruginosa*, for example) or other proteins which raise the pH due to protein hydrolysis and the release of excessive amino acid residues. To eliminate possible protein hydrolysis, perform a control test with the same test medium without urea.⁷
2. Do not heat or reheat the medium because urea decomposes very easily.
3. Urea Agar detects rapid urease activity of only the urease-positive *Proteus* species. For results to be valid for the detection of *Proteus*, the results must be read within the first 2-6 hours after incubation. Urease-positive *Enterobacter*, *Citrobacter* or *Klebsiella*, in contrast, hydrolyze urea much more slowly, showing only slight penetration of the alkaline reaction into the butt of the medium in 6 hours and requiring 3-5 days to change the reaction of the entire butt.

**Urea Broth**

1. To rule out false positives due to protein hydrolysis (as opposed to urea hydrolysis) that may occur in the medium after prolonged incubation, perform a control test with the same test medium without urea.⁷
2. Do not heat or reheat the medium because urea decomposes very easily.
3. The high buffering system in this medium masks urease activity in organisms that are delayed positive. This medium is therefore recommended for the detection of urease activity in all *Proteus* spp., *Providencia rettgeri* and urease-positive *Providencia stuartii*.¹ *M. morganii* slowly hydrolyzes urea and may require approximately a 36 hour incubation for a strong urease-positive reaction to occur.¹ If in doubt as to a result, compare with an uninoculated tube or incubate for an additional 24 hours.
4. Variations in the size of the inoculum can affect the time required to reach positive (alkaline, pH 8.1) results.
