Intended Use

Antibiotic Assay Media are used for determining antibiotic potency by the microbiological assay technique.[1–3]

These media, where noted, meet *United States Pharmacopeia* (*USP*) performance specifications.

Summary and Explanation

The activity (potency) of an antibiotic can be demonstrated under suitable conditions by its inhibitory effect on microorganisms.[2] Reduction in antimicrobial activity may reveal changes not demonstrated by chemical methods.[2] Antibiotic assays are performed by the cylinder plate method and the turbidimetric "tube" assay. The cylinder plate method, first described by Abraham et al.[4] for the assay of penicillin, was later modified by Foster and Woodruff[5] and by Schmidt and Moyer.[6]

Antibiotic assay media are prepared according to the specifications of the *USP*[2], European Pharmacopeia[7] and AOAC International.[3] The antibiotic media are identified numerically with names assigned by Grove and Randall in *Assay Methods of Antibiotics*.[1] Antibiotic Medium 19 corresponds to the use described in *Outline of Details for Official Microbiological Assays of Antibiotics*.[8]

Antibiotic Medium 12 is prepared from the Grove and Randall formula.[1] They recommended its use for preparing test plates for the cylinder plate assay of the antifungal agents, nystatin and anisomycin, using only a seed layer containing *Saccharomyces cerevisiae* as the test organism. It is used for the assay of amphotericin B.

Antibiotic Medium 1 and Antibiotic Medium 4 are used in a cylinder plate method for detecting penicillin in nonfat dry milk.[9]

The use of standardized culture media and careful control of all test conditions are fundamental requisites in the microbiological assay of antibiotics in order to achieve satisfactory test results.

Principles of the Procedure

Cylinder Plate Assay

This method is based on the diffusion of an antibiotic solution from a cylinder placed on the surface of an inoculated agar medium. The diameter of a zone of inhibition after incubation depends, in part, on the concentration or activity of the antibiotic. This method is used in the assay of commercial preparations of antibiotics, as well as in the quantitative determination of antibiotics in body fluids, animal feeds and other materials.

Turbidimetric Assay

The turbidimetric method is based on the inhibition of growth of a microbial culture in a fluid medium containing a uniform solution of an antibiotic.[2] Turbidimetric determinations have the advantage of requiring a short incubation period, providing test results after 3 or 4 hours. However, the presence of solvents or other inhibitory materials may influence turbidimetric assays more markedly than cylinder plate assays. Use of this method is appropriate only when test samples are clear.

Formulae

Difco™ Antibiotic Medium 1 (Penassay Seed Agar)

Approximate Formula* Per Liter		
Beef Extract	1.5	g
Yeast Extract	3.0	g
Pancreatic Digest of Casein	4.0	g
Peptone	6.0	g
Dextrose	1.0	g
Agar	15.0	g

Difco™ Antibiotic Medium 2 (Penassay Base Agar)

Approximate Formula* Per Liter		
Beef Extract	1.5	g
Yeast Extract	3.0	g
Peptone	6.0	g
Agar	15.0	g

Difco™ Antibiotic Medium 3 (Penassay Broth)

Approximate Formula* Per Liter		
Beef Extract	1.5	g
Yeast Extract	1.5	g
Peptone	5.0	g
Dextrose	1.0	g
Sodium Chloride	3.5	g
Dipotassium Phosphate	3.68	g
Monopotassium Phosphate	1.32	g

Directions for Preparation from Dehydrated Product

1. Suspend the powder in 1 L of purified water:
   Difco™ Antibiotic Medium 1 – 30.5 g;
   Difco™ Antibiotic Medium 2 – 25.5 g;
   Difco™ Antibiotic Medium 3 – 17.5 g;
   BBL™ Antibiotic Assay Broth (Antibiotic Medium 3) – 17.5 g;
   Difco™ Antibiotic Medium 4 – 26.5 g;
   Difco™ Antibiotic Medium 5 – 25.5 g;
   Difco™ Antibiotic Medium 8 – 25.5 g;
   Difco™ Antibiotic Medium 9 – 50 g;
   Difco™ Antibiotic Medium 10 – 52 g;
   Difco™ Antibiotic Medium 11 – 30.5 g;
   Difco™ Antibiotic Medium 12 – 62.5 g;
   BBL™ Sabourand Liquid Broth, Modified (Antibiotic Medium 13) – 30 g;
   Difco™ Antibiotic Medium 19 – 60 g.
   Mix thoroughly.
2. Heat with frequent agitation and boil for 1 minute to completely dissolve the powder.
3. Autoclave at 121°C for 15 minutes.
4. To raise the pH of Antibiotic Medium 11 to 8.3 ± 0.1, cool the base to 45-50°C and add NaOH.
5. Test samples of the finished product for performance using stable, typical control cultures.

Procedure

Test Organism Preparation

Maintain stock cultures on agar slants and make transfers at 1- or 2-week intervals. Prepare the inoculum for assay by washing growth from a fresh 24-48 hour agar slant using sterile purified water, saline or Antibiotic Medium 3 and further dilute the culture to obtain the desired organism concentration. In some turbidimetric assays, an 18- to 24-hour culture of the test organism in Antibiotic Medium 3, diluted to obtain the optimal number of organisms, is used.

When *Bacillus subtilis* is used as the test organism, inoculate it on Antibiotic Medium 1 and incubate at 37°C for 1 week, wash spores from the agar surface, and heat the spores at 56°C for 30 minutes. Wash the spores three times in purified water, heat again at 65°C for 30 minutes, and then dilute to the optimal concentration. This inoculum preparation should produce a sharp zone in the assay.

Antibiotic Medium 1 modified by the addition of 300 mg manganese sulfate ($MnSO_4 \cdot H_2O$) per liter often aids the sporulation of *B. subtilis* and may be used in preparing the spore suspension.

When *B. cereus* var. *mycoides* is required, inoculate the organism on Antibiotic Medium 1 and incubate at 30°C for 1 week. Wash and prepare the spores as for *B. subtilis*, above.

Cylinder Plate Assay

Use 20 × 100 mm glass or plastic Petri dishes with sufficient depth so that cylinders used in the assay will not be pushed into the medium by the cover.

Use stainless steel or porcelain assay cylinders having the following dimensions (± 0.1 mm): 8 mm outside diameter, 6 mm inside diameter and 10 mm long.[2] Carefully clean the cylinders to remove all residues, using an occasional acid bath (i.e., with approximately 2N nitric acid or with chromic acid).[2] Four or six cylinders are generally used per plate, evenly spaced on a 2.8 cm radius.

To assure accurate assays, work on a level surface to obtain uniformly thick base and seed layers in the Petri dish. Allow the base layer to solidify and then overlay the seed layer containing a proper concentration of the test organism. The amount of medium in the layers varies for different antibiotics, with most assays specifying a 21 mL base layer and a 4 mL seed layer. In any case, dishes with flat bottoms are required to assure complete coverage of the bottom of the dish when small amounts of base medium are used. Tilt the plate to obtain even coverage of the base layer by the seed layer and allow it to solidify in a level position. Plates should be used the same day as prepared.

Turbidimetric Assay

Use glass or plastic test tubes (i.e., 16 × 125 mm or 18 × 150 mm) that are relatively uniform in length, diameter and thickness and substantially free from surface blemishes.[2] Tubes that will be placed in the spectrophotometer should be matched and free of scratches or blemishes.[2] Clean the tubes thoroughly to remove all antibiotic residues and traces of cleaning solution and, prior to subsequent use, sterilize tubes that have been previously used.[2]

Prepare working dilutions of the antibiotic reference standards in specific concentrations. To a 1 mL quantity of each solution in a suitable tube, add 9 mL of inoculated broth, as required. Prepare similar solutions of the assay materials containing approximately the same amounts of antibiotic activity and place in tubes. Incubate the tubes for 3-4 hours at the required temperature, generally in a water bath. At the end of the incubation period, stop growth by adding 0.5 mL of 1:3 formalin. Determine the amount of growth by measuring light transmittance with a suitable spectrophotometer. Determine the concentration of the antibiotic by comparing the growth obtained with that given by reference standard solutions.

For a complete discussion of antibiotic assay methods, refer to appropriate procedures outlined in the references.[2,3,7]

Expected Results

Refer to appropriate procedures for results.[2,3,7]
